The recognition of the existing in all its dimensions, including the void, the neutralized or the conflicting, the time, the flows, or the out of field. Metabolizing the invisible aims to install a dialectic between Hard and Soft to open new perspectives. Through the tension between sensitive experiences and data; the critical navigation between scales to identify possible articulations; or the temporalization of situations and uses, notably through experimentation and collaborative processes to ease contradictions... Urban metabolism allows us to question the ecological transition (energy, resources, pollution...), with regard to the hypothesis of the fundamental role of technical meshes in the dimensioning of the future urban fabric.

In order to overcome the blocking effects of the planning modes inherited from the twentieth century, we explore strategies of „post-zoning“ compatibilities. To seek compatibilities between registers of the city that were separated in the name of functionalism, and that today end up considerably reducing the friction between functions. It seems to us that it is precisely here that we can and must reappear situations of presence, of mixity, in short, of public project, even if it is only temporarily.

**Matthias Armengaud**
