

Driving data set analysis toolchain

- Public large scale data sets (nuScenes, Berkeley DeepDrive, ...)
- Manually annotated scenes: 2D/3D bounding boxes with pose, type (vehicle, pedestrian, ...)
- Environmental condition annotations: weather, day-time, illumination
- Goals:
 - analyze ***influence of env. conditions*** on visual object detection algorithms, Python implementation
 - Compare with results from literature

- Expected: good programming skills, experienced in Python
