Non-rigid  
Molecules:  
Multiple Potential  
Energy Surfaces

Summary and  
Literature

## Non-rigid molecules

- large amplitude vibrations, for example  $\text{H}_3^+$
- more than one stable structure, for example  $\text{NH}_3$

Let us look at

- the theoretical basis that leads to point group classification
- the true symmetry of the molecular Hamiltonian

Point Groups

Some Properties

Fundamental approximations

Complete Nuclear Permutation and Inversion (CNPI) Groups

Rotational motion

Rigid Molecules

Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

## 1. time-dependent

$$\left[ i\hbar \frac{\partial}{\partial t} - H(\mathbf{Q}, \mathbf{q}, t) \right] \Psi(\mathbf{Q}, \mathbf{q}, t) = 0$$

$$H(\mathbf{Q}, \mathbf{q}) = -\frac{\hbar^2}{2m_e} \sum_i \nabla_i^2 + \sum_l \frac{\hbar^2}{2M_l} \nabla_l^2 + V(\mathbf{Q}, \mathbf{q}, t)$$

## 2. time-independent if potential does not depend on $t$

$$[H(\mathbf{Q}, \mathbf{q}) - E_\alpha] \psi_\alpha(\mathbf{Q}, \mathbf{q}) = 0$$

- translational motion separable from internal motion in absence of magnetic fields

$$[H(\mathbf{R}, \mathbf{r}) - E_\alpha] \psi_\alpha(\mathbf{R}, \mathbf{r}) = 0$$

$\mathbf{Q}, \mathbf{q}$ : coordinates in laboratory system;  $\mathbf{R}, \mathbf{r}$ : coordinates in molecule-fixed system with axes parallel to laboratory system

- internal Schrödinger equation not separable
- sequence of approximations to solve it

Point Groups

Some Properties

Fundamental approximations

Complete Nuclear Permutation and Inversion (CNPI) Groups

Rotational motion

Rigid Molecules

Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

1. of nuclei and electrons: adiabatic approximation ( $M_I \gg m_e$ )

$$\psi_\alpha(\mathbf{R}, \mathbf{r}) = \Phi_n(\mathbf{r}; \mathbf{R}) \Theta_{n\alpha}(\mathbf{R})$$

- notion of potential energy surface
- minimum: concept of molecular structure

2. of electrons: Hartree-Fock

$$\Phi_n(\mathbf{r}; \mathbf{R}) = \hat{A} \prod_i \phi_i(\vec{r}_i; \mathbf{R})$$

- first approximation: doesn't describe dissociation; ca. 2% of electronic energy missing
- followed by a correlation method such as CI

Point Groups

Some Properties

Fundamental approximations

Complete Nuclear Permutation and Inversion (CNPI) Groups

Rotational motion

Rigid Molecules

Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

### 3. of rotation and vibration

$$T = T_{vib} + T_{rot} + T_{rot,vib} ; \quad T_{rot,vib} = 2\vec{\omega} \sum_{I=1}^{3N} M_I \vec{R}_I \times \dot{\vec{R}}_I$$

- Eckart conditions (reference configuration  $\mathbf{R}^0$ )

$$\sum_{I=1}^{3N} M_I \vec{R}_I^0 \times \vec{R}_I = 0$$

### 4. of vibrational modes (reference configuration $\mathbf{R}^0$ )

$$H_{vib} \approx T_{vib} + V_0 + \frac{1}{2} \frac{\partial^2 V}{\partial R_i \partial R_j} \Big|_{R^0} \Delta R_i \Delta R_j + \dots$$

- diagonalization of Hesse matrix
- normal modes: approximate quantum numbers
- selection rules

Point Groups

Some Properties

Fundamental approximations

Complete Nuclear Permutation and Inversion (CNPI) Groups

Rotational motion

Rigid Molecules

Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

## Molecular Hamiltonian

$$H(\mathbf{R}, \mathbf{r}) = -\frac{\hbar^2}{2m_e} \sum_i \nabla_i^2 + \sum_I \frac{\hbar^2}{2M_I} \nabla_I^2 + V(\mathbf{R}, \mathbf{r})$$

with the Coulomb interaction potential

$$V(\mathbf{R}, \mathbf{r}) = \sum_{I \neq J} \frac{Z_I Z_J}{|\vec{R}_I - \vec{R}_J|} + \sum_{i \neq j} \frac{1}{|\vec{r}_i - \vec{r}_j|} - \sum_{li} \frac{Z_I}{|\vec{R}_I - \vec{r}_i|}$$

## Invariances

1. rotation, operator  $J^2$   
 $[H, J^2] = 0$
2. permutation of any two identical particles, operator (12)  
 $[H, (12)] = 0$
3. inversion of the coordinate system, operator  $E^*$   
 $[H, E^*] = 0$

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

Water: 2 identical H atoms, operators (12) and  $E^*$

- Multiplication table of  $S_2 \times I$  permutation-inversion group:

$S_2 \times I$	$E$	(12)	$E^*$	(12)*
$E$	$E$	(12)	$E^*$	(12)*
(12)	(12)	$E$	(12)*	$E^*$
$E^*$	$E^*$	(12)*	$E$	(12)
(12)*	(12)*	$E^*$	(12)	$E$

- Multiplication table of  $C_{2v}$  point group:

$C_{2v}$	$\hat{E}$	$\hat{C}_2$	$\hat{\sigma}_v$	$\hat{\sigma}'_v$
$\hat{E}$	$\hat{E}$	$\hat{C}_2$	$\hat{\sigma}_v$	$\hat{\sigma}'_v$
$\hat{C}_2$	$\hat{C}_2$	$\hat{E}$	$\hat{\sigma}'_v$	$\hat{\sigma}_v$
$\hat{\sigma}_v$	$\hat{\sigma}_v$	$\hat{\sigma}'_v$	$\hat{E}$	$\hat{C}_2$
$\hat{\sigma}'_v$	$\hat{\sigma}'_v$	$\hat{\sigma}_v$	$\hat{C}_2$	$\hat{E}$

- The two groups are isomorphic.
- Molecular symmetry group is called  $C_{2v}(M)$ .

3 identical nuclei

Feasible operations

Ammonia

Ethene

Linear molecules

Rotational motion

Rigid Molecules

Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

CNPI group is  $S_3 \times I$

- operators:  $E, \{(12), (23), (13)\}, \{(123), (132)\}$  and  $E^*, \{(12)^*, (23)^*, (13)^*\}, \{(123)^*, (132)^*\}$
- $S_3 \times I$  isomorphic with  $D_{3h}$
- character table

$S_3 \times I$	$E$	$\{(123), (132)\}$	$\{(12), (23), (13)\}$	$E^*$	$\{(123)^*, (132)^*\}$	$\{(12)^*, (23)^*, (13)^*\}$
$D_{3h}$	$E$	$2C_3$	$3C_2$	$\sigma_h$	$2S_3$	$3\sigma_v$
$A_1'$	1	1	1	1	1	1
$A_2'$	1	1	-1	1	1	-1
$E'$	2	-1	0	2	-1	0
$A_1''$	1	1	1	-1	-1	-1
$A_2''$	1	1	-1	-1	-1	1
$E''$	2	-1	0	-2	1	0

- $D_{3h}(M)$  is the molecular symmetry group of  $H_3^+, BF_3, \dots$

## Point Groups

Complete Nuclear

## Rotational motion

## Rigid Molecules

## Floppy Molecules

Non-rigid  
Molecules: Single  
Potential Energy  
Surface

Non-rigid  
Molecules:  
Multiple Potential  
Energy Surfaces

Summary and  
Literature

- Two "versions" of  $\text{CH}_3\text{F}$ . They differ from ordering (clockwise, anti-clockwise) of H atoms looking along  $\text{F} \Rightarrow \text{C}$

- passing between the two structures only via high-energy planar transition state: not feasible
- hence (12), (23) and (13) are not feasible operations
- $E^*$  not feasible either
- however (12)\* etc. are feasible
- Molecular symmetry group  $C_{3v}(M)$  by  $E$ ,  $\{(123), (132)\}$ ,  $\{(12)^*, (23)^*, (13)^*\}$
- $C_{3v}(M)$  is a sub group of  $D_{3h}(M)$ , see previous slide

## Point Groups

Complete Nuclear Permutation and Inversion (CNPI) Groups

2 identical nuclei: water

3 identical nuclei Feasible operations

## Ammonia

Ethene

Linear molecules

## Rotational motion

Rigid Molecules

## Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

- CNPI group has order  $n = 1! \times 3! \times 2 = 12$
- 2 versions of ammonia

- low inversion barrier: all operations feasible
- Molecular symmetry group is  $D_{3h}(M) = C_{3v}(M) \times (E, E^*)$ , order  $n = 12$
- “doubling” of rovibrational states (symmetric and anti-symmetric with respect to (12) etc.), observable splitting

$C_{3v}(M)$	$D_{3h}(M)$
$A_1$	$A'_1 + A''_2$
$A_2$	$A'_2 + A''_1$
$E$	$E' + E''$

# Ethene $\text{H}_2\text{C} = \text{CH}_2$

### Rotational motion

### Rigid Molecules

### Floppy Molecules

Non-rigid  
Molecules: Single  
Potential Energy  
Surface

Non-rigid  
Molecules:  
Multiple Potential  
Energy Surfaces

Summary and  
Literature

- CNPI group has order  $n = 2! \times 4! \times 2 = 96$
- 12 versions of ethene

- unfeasible operations would rupture bonds, (12), (56) etc.
- feasible operations are  $E$ , (12)(34), (13)(24)(56), (14)(23)(56) and  $E^*$ , (12)(34)\*, (13)(24)(56)\*, (14)(23)(56)\*

## ■ Comparison of linear and angular motions

Linear Motion		Angular Motion
	<i>Position</i>	
Distance, $x$		Angle, $\theta$
	<i>Velocity</i>	
Velocity, $v = \dot{x} = dx/dt$		Angular velocity, $\omega = \dot{\theta} = d\theta/dt$
	<i>Acceleration</i>	
Acceleration, $a = \ddot{x} = d^2x/dt^2$		Angular acceleration, $\alpha = \ddot{\theta} = d^2\theta/dt^2$
	<i>Mass</i>	
Mass, $m$		Moment of inertia, $I = mr^2$
	<i>Momentum</i>	
Linear momentum, $p = mv$		Angular momentum, $L = I\omega$
	<i>Kinetic energy</i>	
$E_k = \frac{1}{2}mv^2 = p^2/2m$		$E_k = \frac{1}{2}I\omega^2 = L^2/2I$
	<i>Force</i>	
Force, $F$		Torque, $T$
	<i>Newton's second law</i>	
$F = ma = dp/dt$		$T = I\alpha = dL/dt$

## ■ Angular momentum in molecule-fixed axis system ( $x', y', z'$ ):

$$\begin{pmatrix} L'_x \\ L'_y \\ L'_z \end{pmatrix} = \begin{pmatrix} \sum m_a(y_a'^2 + z_a'^2) & -\sum x'_a y'_a & -\sum x'_a z'_a \\ -\sum y'_a x'_a & \sum m_a(x_a'^2 + z_a'^2) & -\sum y'_a z'_a \\ -\sum z'_a x'_a & -\sum z'_a y'_a & \sum m_a(y_a'^2 + z_a'^2) \end{pmatrix} \begin{pmatrix} \omega'_x \\ \omega'_y \\ \omega'_z \end{pmatrix}$$

## ■ Principal axes by diagonalisation of tensor of inertia

$$\begin{aligned} \mathbf{L}' &= \mathbf{I}'\boldsymbol{\omega}' = \mathbf{X}\mathbf{X}^{-1}\mathbf{I}'\mathbf{X}\mathbf{X}^{-1}\boldsymbol{\omega}' = \mathbf{X}\mathbf{I}\mathbf{X}^{-1}\boldsymbol{\omega}' \\ \mathbf{X}^{-1}\mathbf{L}' &= \mathbf{I}\mathbf{X}^{-1}\boldsymbol{\omega}' \\ \mathbf{L} &= \mathbf{I}\boldsymbol{\omega} \end{aligned}$$

$$\begin{pmatrix} L_x \\ L_y \\ L_z \end{pmatrix} = \begin{pmatrix} \sum m_a(y_a^2 + z_a^2) & 0 & 0 \\ 0 & \sum m_a(x_a^2 + z_a^2) & 0 \\ 0 & 0 & \sum m_a(y_a^2 + z_a^2) \end{pmatrix} \begin{pmatrix} \omega_x \\ \omega_y \\ \omega_z \end{pmatrix}$$

- Rotational energy

$$\begin{aligned} E_{rot} &= \frac{1}{2} \boldsymbol{\omega}^T \mathbf{I} \boldsymbol{\omega} = \frac{1}{2} I_{xx} \omega_x^2 + \frac{1}{2} I_{yy} \omega_y^2 + \frac{1}{2} I_{zz} \omega_z^2 \\ &= \frac{L_x^2}{2I_{xx}} + \frac{L_y^2}{2I_{yy}} + \frac{L_z^2}{2I_{zz}} \\ &= \frac{L_a^2}{2I_A} + \frac{L_b^2}{2I_B} + \frac{L_c^2}{2I_C} \\ &= AL_a^2 + BL_b^2 + CL_c^2 \end{aligned}$$

- Spectroscopic convention for moments of inertia:  $I_A \leq I_B \leq I_C$   
for rotational constants:  $A \geq B \geq C$

## Point Groups

## Complete Nuclear Permutation and Inversion (CNPI) Groups

## Rotational motion Definitions

## Rotating molecules

## Rigid Molecules

## Floppy Molecules

## Non-rigid Molecules: Single Potential Energy Surface

## Non-rigid Molecules: Multiple Potential Energy Surfaces

## Summary and Literature

1. Linear polyatomic molecule:  $A = 0, B = C$

$$T_{rot} = A\hat{J}_a^2 + B(\hat{J}_b^2 + \hat{J}_c^2) = B(\hat{J}^2 - \hat{J}_a^2)$$

$$E_{rot} = BJ(J + 1) - Bk_a^2$$

2. Spherical top:  $A = B = C$ , example  $\text{CH}_4$

$$T_{rot} = B(\hat{J}_a^2 + \hat{J}_b^2 + \hat{J}_c^2) = B\hat{J}^2$$

$$E_{rot} = BJ(J + 1)$$

3. Symmetric top: two rotational constants are equal

- prolate top:  $A > B = C$ , example  $\text{CH}_3\text{F}$

$$T_{rot} = A\hat{J}_a^2 + B(\hat{J}_b^2 + \hat{J}_c^2) = B(\hat{J}^2 - \hat{J}_a^2) + A\hat{J}_a^2 = B\hat{J}^2 + (A - B)\hat{J}_a^2$$

$$E_{rot} = BJ(J + 1) + \underbrace{(A - B)k_a^2}_{> 0}$$

$E_{rot}$  increases with  $K_a = |k_a|$  for given  $J$

- oblate top:  $A = B > C$ , examples  $\text{NH}_3, \text{BF}_3, \text{H}_3^+$

$$T_{rot} = B(\hat{J}_a^2 + \hat{J}_b^2) + C\hat{J}_c^2 = B(\hat{J}^2 - \hat{J}_c^2) + C\hat{J}_c^2 = B\hat{J}^2 + (C - B)\hat{J}_c^2$$

$$E_{rot} = BJ(J + 1) + \underbrace{(C - B)k_c^2}_{< 0}$$

$E_{rot}$  decreases with  $K_c = |k_c|$  for given  $J$

Definitions

Rotating molecules

Rigid Molecules

Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

4. Asymmetric top:  $A > B > C$ , example  $H_2O$

$$\begin{aligned}
 T_{rot} &= A\hat{J}_a^2 + B(\hat{J}_b^2 + \hat{J}_c^2) \\
 &= A\hat{J}_a^2 + \frac{1}{2}(B + C)(\hat{J}_b^2 + \hat{J}_c^2) + \frac{1}{2}(B - C)(\hat{J}_b^2 - \hat{J}_c^2) \\
 &= A\hat{J}_a^2 + \frac{1}{2}(B + C)(\hat{J}^2 - \hat{J}_a^2) + \frac{1}{2}(B - C)(\hat{J}^{+2} + \hat{J}^{-2})
 \end{aligned}$$

with  $\hat{J}^\pm = \hat{J}_b \pm i\hat{J}_c$ . Matrix elements in the prolate top  $|Jk_a\rangle$  basis:

$$\begin{aligned}
 \langle Jk_a | T_{rot} | Jk'_a \rangle &= Ak_a^2 \delta_{k_a k'_a} + \frac{1}{2}(B + C) [J(J + 1) - k_a^2] \delta_{k_a k'_a} \\
 &\quad + \frac{1}{2} \underbrace{\langle Jk_a | \hat{J}^{+2} | Jk'_a \rangle}_{\sim \delta_{k_a k'_a + 2}} + \frac{1}{2} \underbrace{\langle Jk_a | \hat{J}^{-2} | Jk'_a \rangle}_{\sim \delta_{k_a k'_a - 2}}
 \end{aligned}$$

$k_a$  not conserved, but  $(-1)^{K_a}$  is (likewise  $(-1)^{K_c}$ ). Correlation with symmetric tops:

## Representation of rotational functions and their symmetry

- $(\theta, \phi, \chi | Jkm) = \sqrt{\frac{2J+1}{8\pi^2}} D_{mk}^{J*}(\phi, \theta, \chi) \sim e^{im\phi} d_{mk}^J(\theta) e^{ik\chi}$
- $D_{km}^J$  are Wigner rotation functions, depending on the Euler angles  $\theta, \phi, \chi$
- molecule-fixed axes parallel to laboratory system:  $(\xi, \eta, \zeta)$   
molecule-fixed axes equivalent to principal axes:  $(x, y, z)$   
 $k$  and  $m$  are internal,  $z$ , and external,  $\zeta$ , projections

- $x, y, z$  axes defined with respect to numbered particles
- permutation of particles then reorients  $(x, y, z)$  axes, hence the Euler angles change
- transformation of Euler angles in CNPI to be studied casewise:  $H_2, H_2O$

Summary and  
Literature

### ■ inversion

$$E^*(\theta, \phi, \chi) = (\pi - \theta, \phi + \pi, \pi - \chi)$$

### ■ permutation (equivalent x-rotation by $\pi$ )

$$(12)(\theta, \phi, \chi) = (\pi - \theta, \phi + \pi, 2\pi - \chi)$$

it follows that  $(12)^*(\theta, \phi, \chi) = (\theta, \phi, \chi + \pi)$ , i.e. a z-rotation by  $\pi$

### ■ effect on $|Jkm\rangle$

$$(12)|Jkm\rangle = (-1)^J |J, -k, m\rangle$$

$$(12)^*|Jkm\rangle = (-1)^k |J, k, m\rangle$$

$$E^*|Jkm\rangle = (-1)^{J+k} |J, -k, m\rangle$$

Summary

### Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

- The asymmetric top Hamiltonian is diagonalized in the Wang basis
- Degenerate symmetric top states are split into two parity components
- Prolate ( $K_a$ ) and oblate ( $K_c$ ) quantum numbers used for labelling
- Symmetry of rotational functions  $|JK_a K_c\rangle$ :

- symmetric w.r.t. (12):  
 $A_1, A_2$ , to be combined with singlet nuclear spin of protons (para)
- anti-symmetric w.r.t. (12):  
 $B_1, B_2$ , to be combined with triplet nuclear spin of protons (ortho)  
(just as in H<sub>2</sub>)

Summary

## Floppy Molecules

Non-rigid  
Molecules: Single  
Potential Energy  
Surface

Non-rigid  
Molecules:  
Multiple Potential  
Energy Surfaces

Summary and  
Literature

Symmetry of vibrational functions  $|v_1 v_2 v_3\rangle$ :

- $\Gamma(\nu_1) = A_1, \Gamma(\nu_2) = A_1, \Gamma(\nu_3) = B_2$

- Examples:

$$\Gamma(|200\rangle) = A_1 \times A_1 = A_1,$$

$$\Gamma(|002\rangle) = B_2 \times B_2 = A_1,$$

$$\Gamma(|011\rangle) = A_1 \times B_2 = B_2,$$

$$\Gamma(|111\rangle) = A_1 \times A_1 \times B_2 = B_2, \text{ etc.}$$

- Rules for direct products:

$$A \times A = A, A \times B = B, B \times A = B, B \times B = A,$$

$$"1" \times "1" = "1", "1" \times "2" = "2", "2" \times "1" = "2", "2" \times "2" = "1"$$

- General expression:

$$\Gamma(|v_1 v_2 v_3\rangle) = A_1^{v_1} \times A_1^{v_2} \times B_2^{v_3} = \begin{cases} A_1 & \text{if } v_3 \text{ even} \\ B_2 & \text{if } v_3 \text{ odd} \end{cases}$$

Summary

Floppy Molecules

Non-rigid  
Molecules: Single  
Potential Energy  
Surface

Non-rigid  
Molecules:  
Multiple Potential  
Energy Surfaces

Summary and  
Literature

- Symmetry:  $\Gamma_{rovib} = \Gamma_{rot} \times \Gamma_{vib}$

$K_a$	$K_c$	$\Gamma(\text{weight})$	
		$v_3$ even	$v_3$ odd
e	e	$A_1(1)$	$B_2(3)$
e	o	$B_1(3)$	$A_2(1)$
o	e	$B_2(3)$	$A_1(1)$
o	o	$A_2(1)$	$B_1(3)$

Note:  $A$  symmetry states to be combined with singlet nuclear spin  $B_2$ ,  
 $B$  symmetry states to be combined with triplet nuclear spin  $A_1$

- Dipole transition rules:  $\Gamma(\vec{\mu}) = A_2$  (antisymm. w.r.t.  $E^*$ )

$$\Gamma(\langle \Psi_i | \vec{\mu} | \Psi_f \rangle) = A_1$$

Possible transitions:  $A_1 \rightleftharpoons A_2$ ,  $B_1 \rightleftharpoons B_2$  with  $\Delta J = 0, \pm 1$

## Comments:

1. disadvantage of CNPI group: may be very large
2. use subgroup built up by feasible operations: equivalent to point group for rigid molecules
3. exact quantum numbers are  $J, \Gamma, n$  ( $n$  is a counting index)
4. spectroscopic (vib, rot) quantum numbers are not exact, but often “good” quantum numbers
5. “spectroscopic” states with same exact symmetry may interact and lead to perturbations in the spectra

Summary and  
Literature

from J. Gottfried, Oka group (Chicago): J. Chem. Phys. **118**, 10890 (2003)

## New Vibrational Bands

- so far we have classified spectroscopic quantum numbers  $(v_1, v_2^{|\ell|})$  in exact symmetry group
- “spectroscopic” states with same symmetry may “perturb” each other
- above “barrier to linearity” spectroscopic quantum numbers begin to fail
- $J$  and exact CNPI quantum numbers hold:  $J, \Gamma, n$ , with  $n$  a counting index
- compute rovibrational states using coordinates not derived from potential minimum: hyperspherical coordinates

## Point Groups

Energy Surfaces

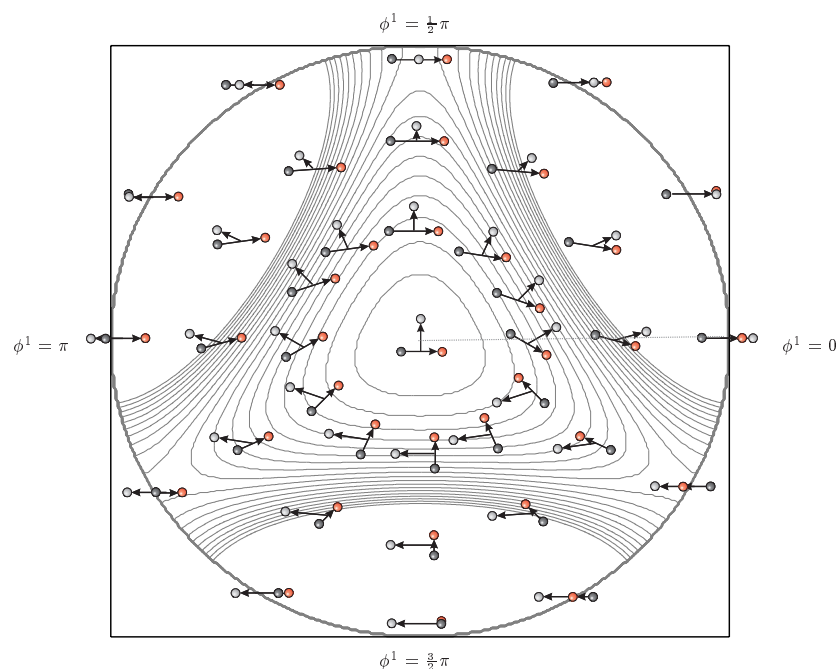

Summary and  
Literature

### Jacobi coordinates: $\mathbf{r}_k, \mathbf{R}_k$

### Hyperspherical coordinates:

internal coordinates:  $\rho, \theta, \phi$ , Euler angles:  $\phi^E, \theta^E, \chi^E$

### Hyperspherical harmonics, $\Psi(\theta, \phi, \phi^E, \theta^E, \chi^E)$ may be symmetrized within $S_3 \times I$ and allow exact computations

Summary and Literature

- $3N - 6 = 6$  vibrational modes: in the  $C_{3v}$  point group  $\Gamma_{vib} = 2A_1 + 2E$   
 two versions, tunneling feasible: full CNPI group  $S_3 \times I$ , molecular symmetry group  $D_{3h}(M)$

$C_{3v}(M)$			$D_{3h}(M)$		
mode	designation	$\Gamma$	mode	designation	$\Gamma$
$\nu_1$	symmetric stretch	$A_1$			$A_1'$
$\nu_2$	bending	$A_1$	$\nu_{inv}$	inversion	$A_2''$
$\nu_3$		$E$			$E_2'$
$\nu_4$		$E$			$E'$

- character table

$S_3 \times I$		E	$\{(123), (132)\}$	$\{(12), (23), (13)\}$	$E^*$	$\{(123)^*, (132)^*\}$	$\{(12)^*, (23)^*, (13)^*\}$
$D_{3h}(M)$	$C_{3v}(M)$	E	$2C_3$	$3C_2$	$\sigma_h$	$2S_3$	$3\sigma_v$
$A_1'$	$A_1$	1	1	1	1	1	1
$A_2'$	$A_2$	1	1	-1	1	1	-1
$E'$	$E$	2	-1	0	2	-1	0

Water dimer  
Triplet  $H_3^+$

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

- bending levels  $v_2$  split into  $v_2^\pm \equiv v_{inv}$

- nuclear spin functions as in  $H_3^+$ :  $I = 3/2$  ( $\Gamma = A_1'$ ),  $I = 1/2$  ( $\Gamma = E'$ )

$\Gamma_{ns}$	$\Gamma_{rovib}$	$\Gamma_{tot}$
$A_1'$	$A_2'$	$A_1' \times A_2' = A_2'$
	$A_2''$	$A_1' \times A_2'' = A_2''$
$E'$	$E'$	$E' \times E' = A_2'(+A_1' + E')$
	$E''$	$E' \times E'' = A_2''(+A_1'' + E'')$

- missing levels:  $v_{inv}^{2n}$ ,  $\Gamma = (A_2'' \times A_2'')^n = A_1'$
- also missing: overtones with  $A_1'$  symmetry, for example  $|v_1, v_2, v_3, v_4\rangle = |0, 0, 2, 0\rangle$   
 $\Gamma(|0, 0, 2, 0\rangle) = A_1 \times A_1 \times E^2 \times A_1 = A_1 + E \rightarrow (A_1' + A_2'') + (E' + E'')$
- reverse correlation table with proton statistical weights

$C_{3v}(M)$	$A_1(4)$	$A_2(4)$	$E(4)$
$D_{3h}(M)$	$A_1'(0) + A_2''(4)$	$A_2'(4) + A_1''(0)$	$E'(2) + E''(2)$

# Water dimer

Molecules: Single  
Potential Energy  
Surface

Ammonia

Water dimer

Triplet  $H_3^+$

Non-rigid  
Molecules:  
Multiple Potential  
Energy Surfaces

Summary and  
Literature

- Order of CNPI group =  $4! \times 2! \times 2 = 96$ , order of the  $C_s$  point group of rigid dimer = 2, hence  $96/2 = 48$  versions

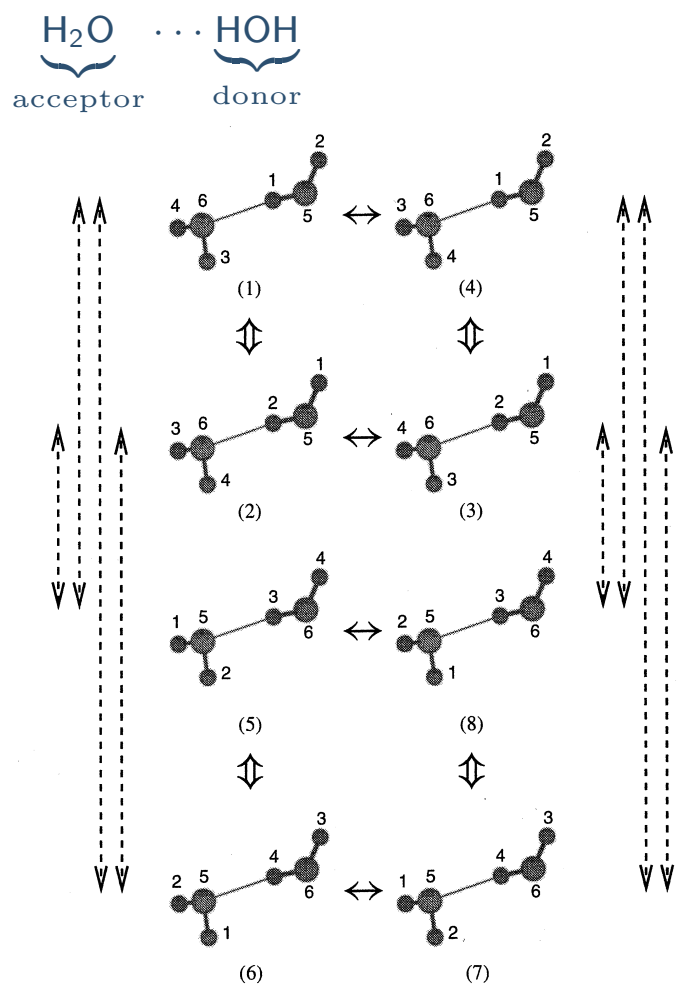

- feasible operations:

- exchange of acceptor H atoms by rotation, “acceptor switching”,  $\Delta E \approx 200\text{cm}^{-1}$
- exchange of donor H atom that makes hydrogen bond, “bifurcation”,  $\Delta E \approx 650\text{cm}^{-1}$
- exchange of donor and acceptor roles, “donor-acceptor interchange”,  $\Delta E \approx 300\text{cm}^{-1}$

hence  $2 \times 2 \times 2 = 8$  connected versions

- 6 sets of 8 versions, passing between sets involves bond breaking. Not feasible

Non-rigid Molecules: Single Potential Energy Surface

Ammonia

## Water dimer

Triplet  $H_3^+$

Non-rigid Molecules: Multiple Potential Energy Surfaces

Summary and Literature

each hypothetical rigid dimer state is split into eight states, observable

1. acceptor switching,  $\Delta E \approx 200\text{cm}^{-1}$
  2. donor-acceptor interchange,  $\Delta E \approx 300\text{cm}^{-1}$
  3. bifurcation (donor switching),  $\Delta E \approx 650\text{cm}^{-1}$
- can be surpassed by donor-acceptor interchanges  $(1) \rightleftharpoons (5) \rightleftharpoons (2)$

Rotational motion

Rigid Molecules

Floppy Molecules

Non-rigid Molecules: Single Potential Energy Surface

Non-rigid Molecules: Multiple Potential Energy Surfaces

Triplet  $H_3^+$ , Jahn-Teller effect

Summary and Literature

- adiabatic (one-state) representation: electronic state  ${}^3\Sigma_u^+$ , symmetry  $A_2'$  in CNPI symmetry of vibrational states

- ortho nuclear spin

$\Gamma_{el} \times \Gamma_{ns} = A_2' \times A_1' = A_2'$ , vibrational state must have  $A_1'$  symmetry

$$\Gamma_{tot} = \Gamma_{el} \times \Gamma_{ns} \times \Gamma_{vib} = A_2' \times A_1' \times A_1' = A_2'$$

- para nuclear spin

$\Gamma_{el} \times \Gamma_{ns} = A_2' \times E' = E'$ , vibrational state must have  $E'$  symmetry

$$\Gamma_{tot} = \Gamma_{el} \times \Gamma_{ns} \times \Gamma_{vib} = A_2' \times E' \times E' = A_2'(+A_1' + E')$$

- diabatic (two-state) representation: electronic state  ${}^3E'$ , symmetry  $E'$  in CNPI symmetry of vibrational states

- ortho nuclear spin

$\Gamma_{el} \times \Gamma_{ns} = E' \times A_1' = E'$ , vibrational state must have  $E'$  symmetry

$$\Gamma_{tot} = \Gamma_{el} \times \Gamma_{ns} \times \Gamma_{vib} = E' \times A_1' \times E' = A_2'(+A_1' + E')$$

- para nuclear spin

$\Gamma_{el} \times \Gamma_{ns} = E' \times E' = A_1' + A_2' + E'$ , vibrational state may have any symmetry

$$\Gamma_{tot} = \Gamma_{el} \times \Gamma_{ns} \times \Gamma_{vib} = \begin{cases} E' \times E' \times A_1' & = A_2' (+A_1' + E') \\ E' \times E' \times A_2' & = A_2' (+A_1' + E') \\ E' \times E' \times E' & = A_2' (+A_1' + 3E') \end{cases}$$

- statistical weights of vibrational states

$\Gamma_{vib}$	$W(1\text{ st.})$	$W(2\text{ st.})$	
$A_1'$	4	2	
$A_2'$	0	2	may be helpful to detect geometrical phase
$E'$	2	6

## Non-rigid Molecules: Multiple Potential Energy Surfaces

## Summary and Literature

## Summary

## Literature

- Point group symmetry is approximate and can only be used for rigid molecules
- The CNPI, complete nuclear permutation inversion group, introduced by Longuet-Higgins, gives the exact symmetry
- CNPI may be very large, unfeasible operations are removed to obtain the molecular symmetry (MS) group.  
Example: ethene, order of CNPI group =  $2! \times 4! \times 2 = 96$ . The MS group ( $D_{2h}(M)$ ) has order 8.
- CNPI describes rigid molecules, in this case the CNPI group is isomorphic with the point group.  
Example: water, order of CNPI group =  $2! \times 1 \times 2 = 4$ , order of point group  $C_{2v}$  is 4. The MS group is  $C_{2v}(M)$ .
- CNPI describes floppy molecules that strongly depart from equilibrium configuration.  
Example: singlet  $H_3^+$ , triangle at equilibrium, but linear configurations accessible at high energy. Breakdown of point group classification of vibrational states.
- CNPI describes non-rigid molecules that have more than one minimum on the potential energy surface.  
Example: ammonia, weakly bound complexes such as the water dimer
- CNPI describes non-rigid molecules that cannot be treated within the adiabatic approximation of a single electronic state. The participating electronic states may have different symmetry.  
Example: triplet  $H_3^+$  which shows a Jahn-Teller effect
