Context-dependent information space for construction information processes

Dr.-Ing. Frank Hilbert

SBE19 Graz

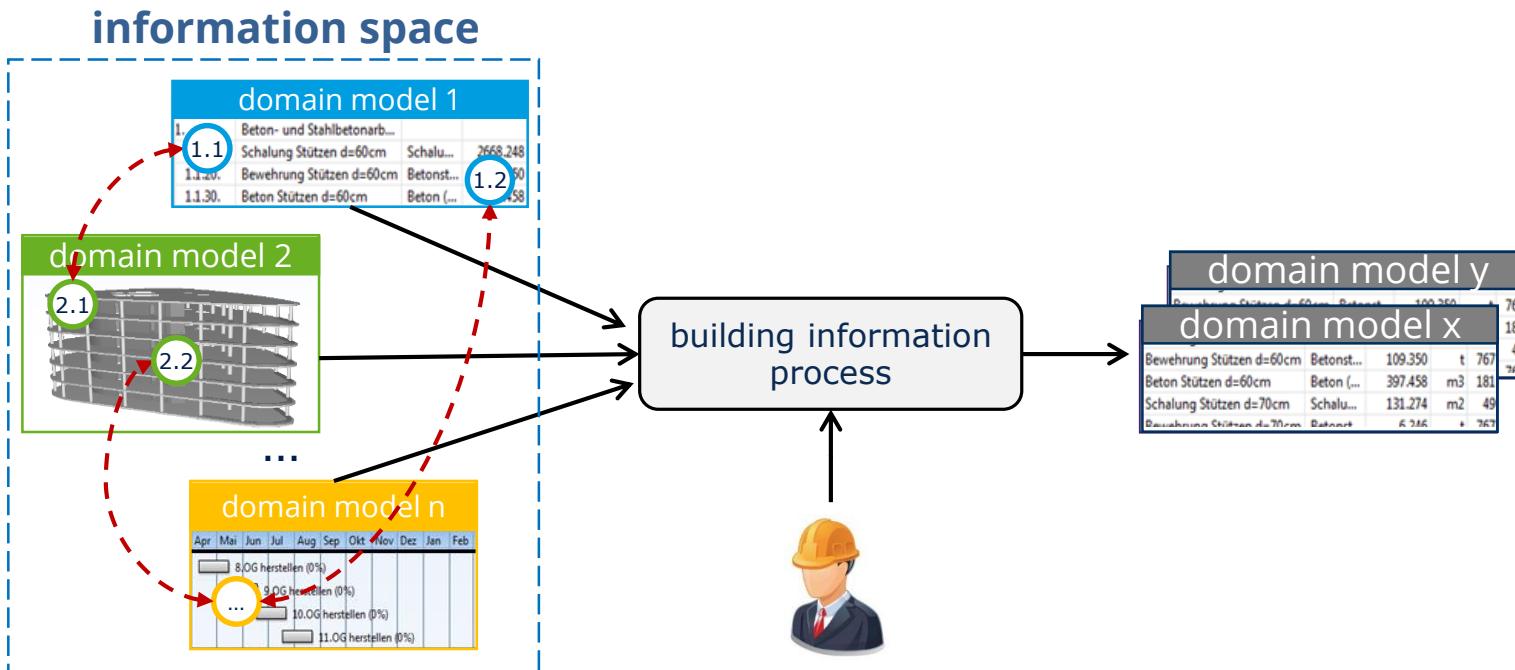

Collaborative Building Information Processes

- many actors
- various specialized applications
- different domain information models
- information exchange: cross-model, cross-format, cross-domain and cross-organizational

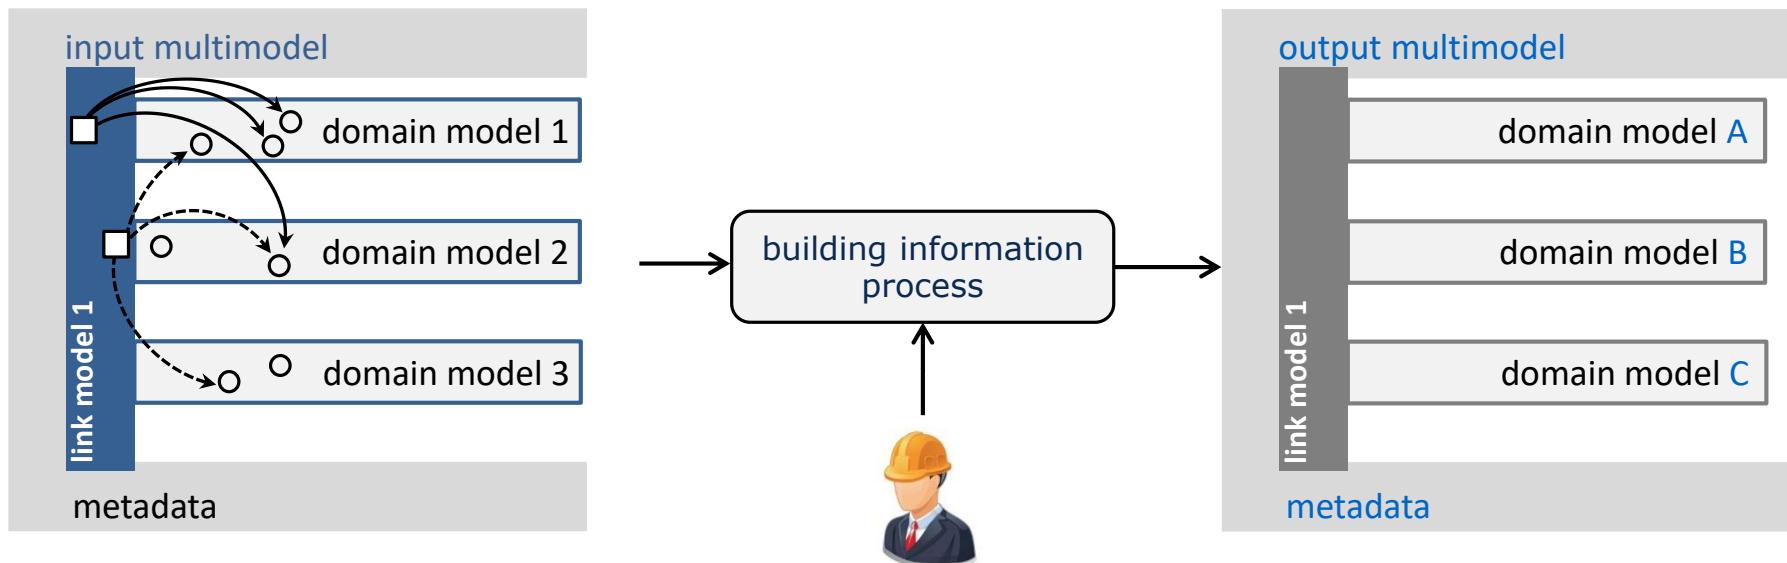

Information Space

- various functional and organizational information must be processed together → **interdependencies**

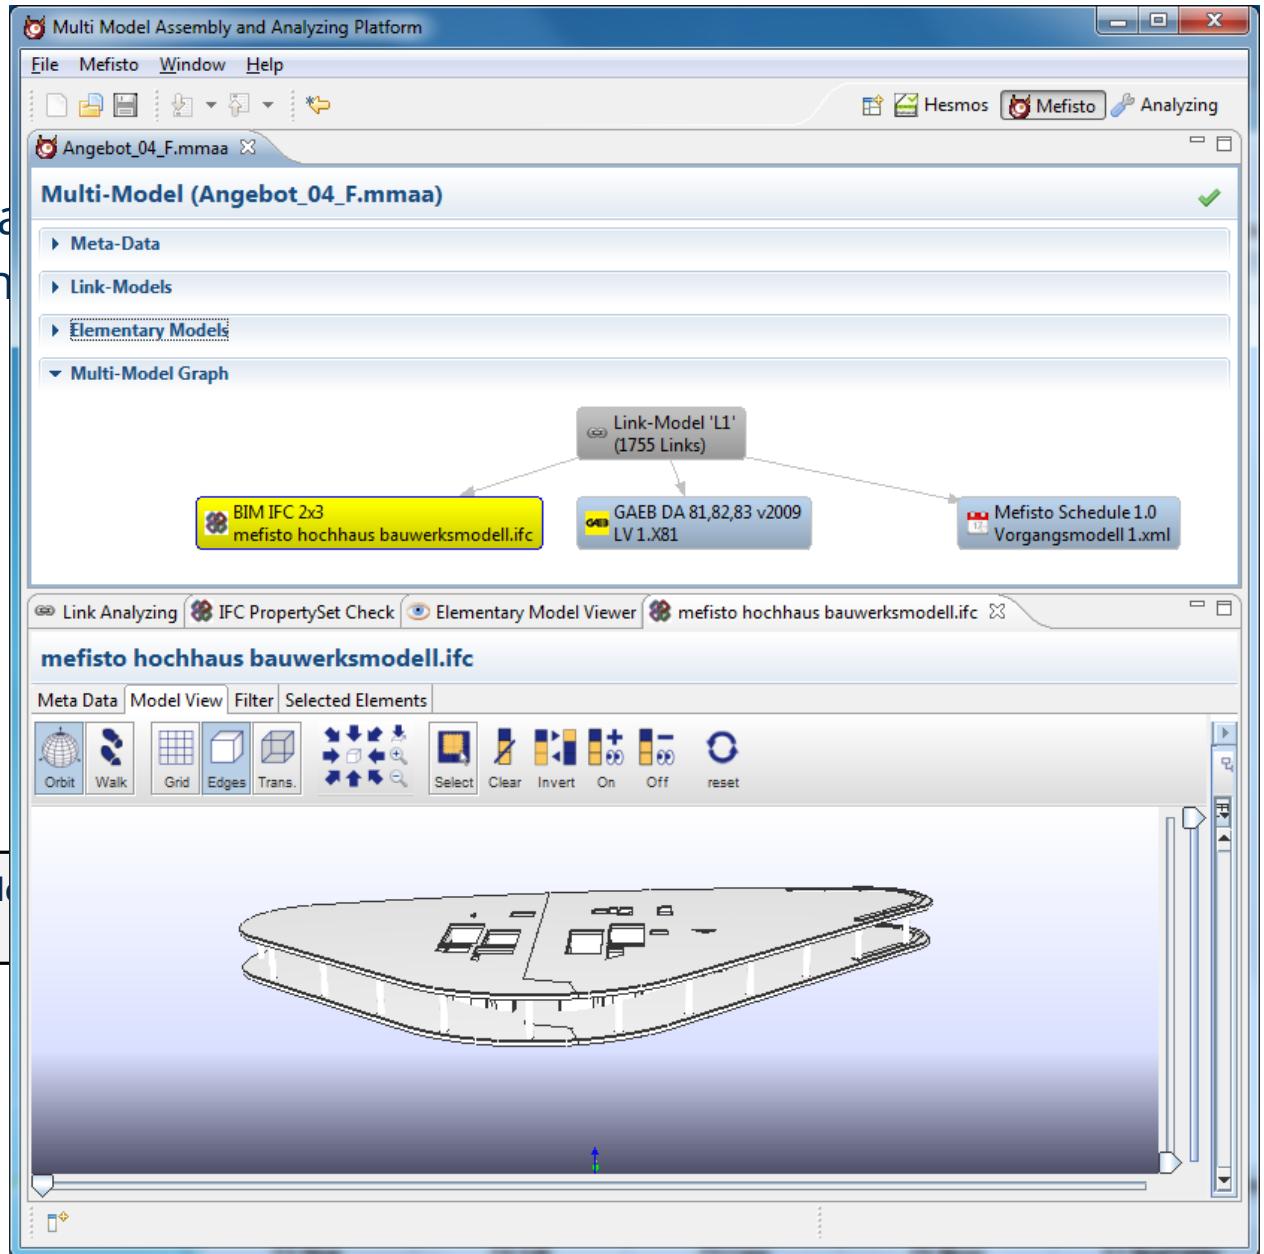

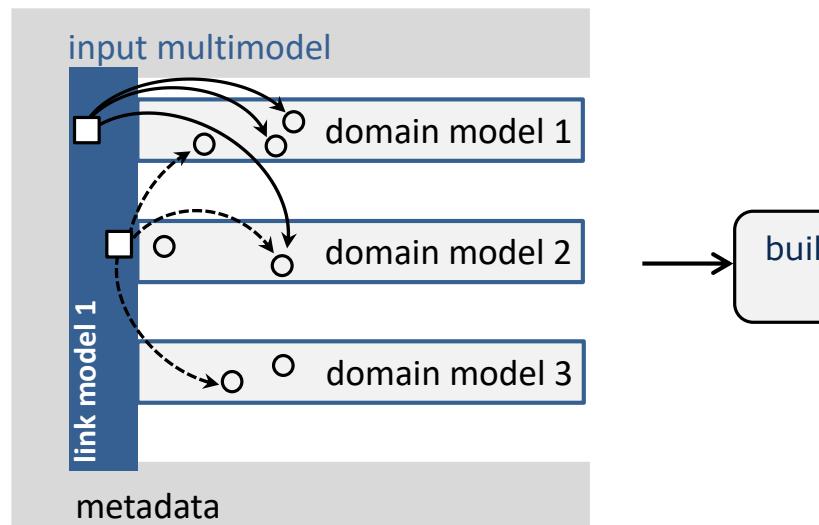

Generic Multimodel

- published as MMC 2.0 container by BuildingSmart
- standardized by DIN SPEC 91350 for BIM- LV containers (IFC + GAEB)

Generic Multimodel

- published as MMC 2.0 container by BuildingSmart
- standardized by DIN SPEC 91350 for BIM- LV con

Problem: Multimodel Size

increasing **size** and **amount** of information models:

- more complex production processes and buildings
- new requirements (energy efficiency / sustainability / life cycle considerations)
- increasing quality and granularity
- increasing number of involved actors and domains

→ **multimodels become very large**

complicates the handling and acceptance:

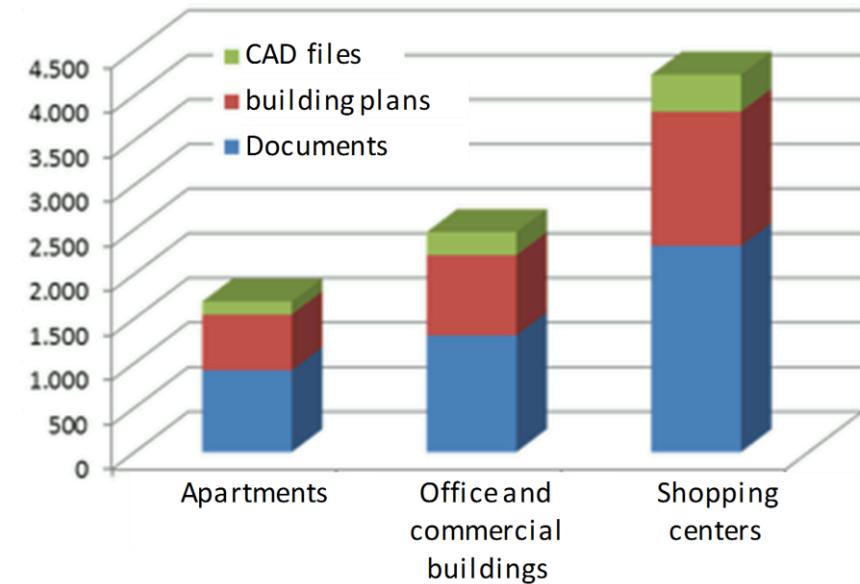

- orientation and localization of required detail information
- tracing of model dependencies
- hardly to estimate which subset is relevant
- mobile usability
- security issues

→ Missing, misinterpreted or incorrect information often causes
quality defects, delays or cost overruns

Objectives:

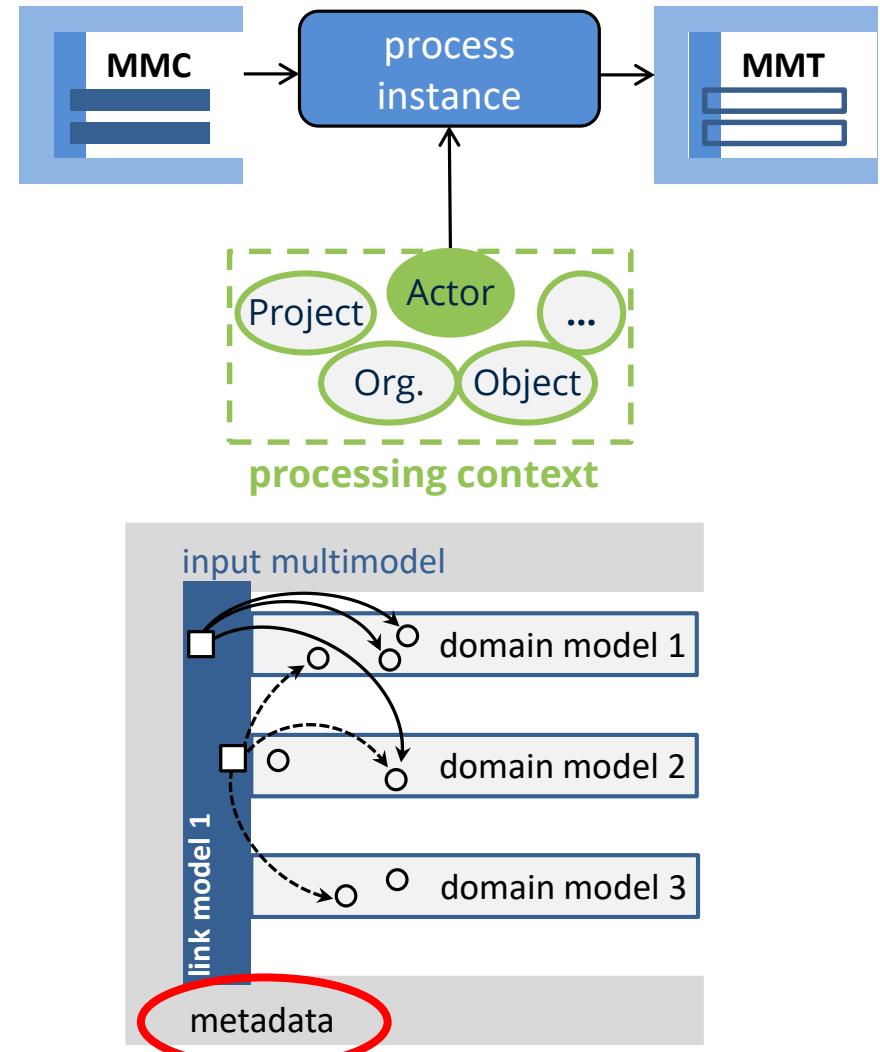

- limit the quantity, scope and complexity of the information exchanged
- by **needs-based information supply**

turnkey construction

Context dependency of Multimodels

- Information processes are embedded in a task context
 - task context determines the information requirements:
 - specific model sections,
 - model qualities
 - model interrelationships
 - certain building parts,
 - corresponding properties
 - allocation units or individual dates and time windows
 - different aspects of the processing context determine the **precisely fitting information spaces**
- context dependency of information requirements

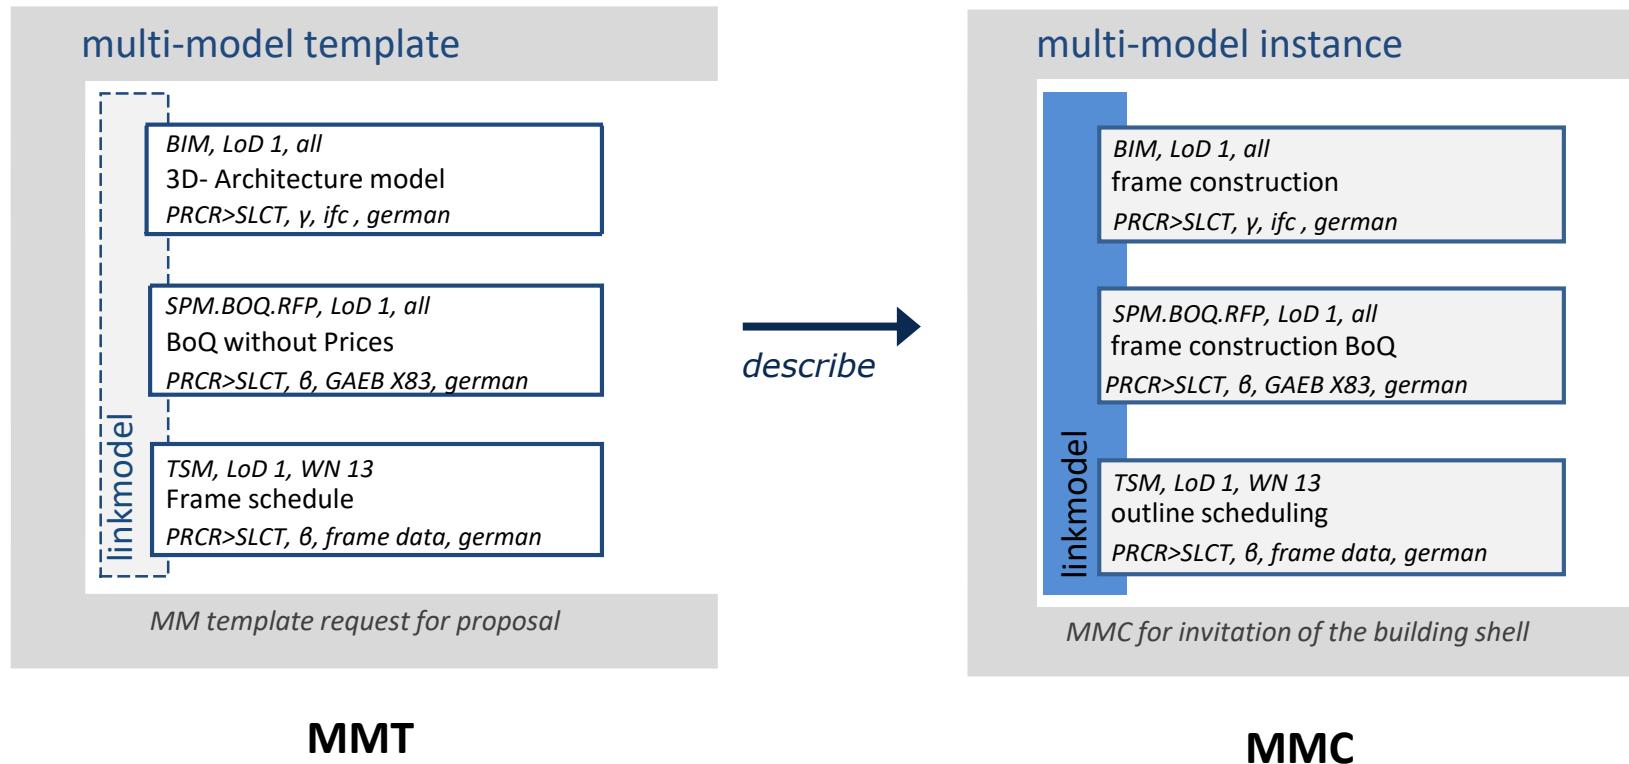

Context information for construction information processes

- processing context: **main elements** (process, actor and resource) and **associated sub-aspects**.
- context aspects differ in influence on the information requirements

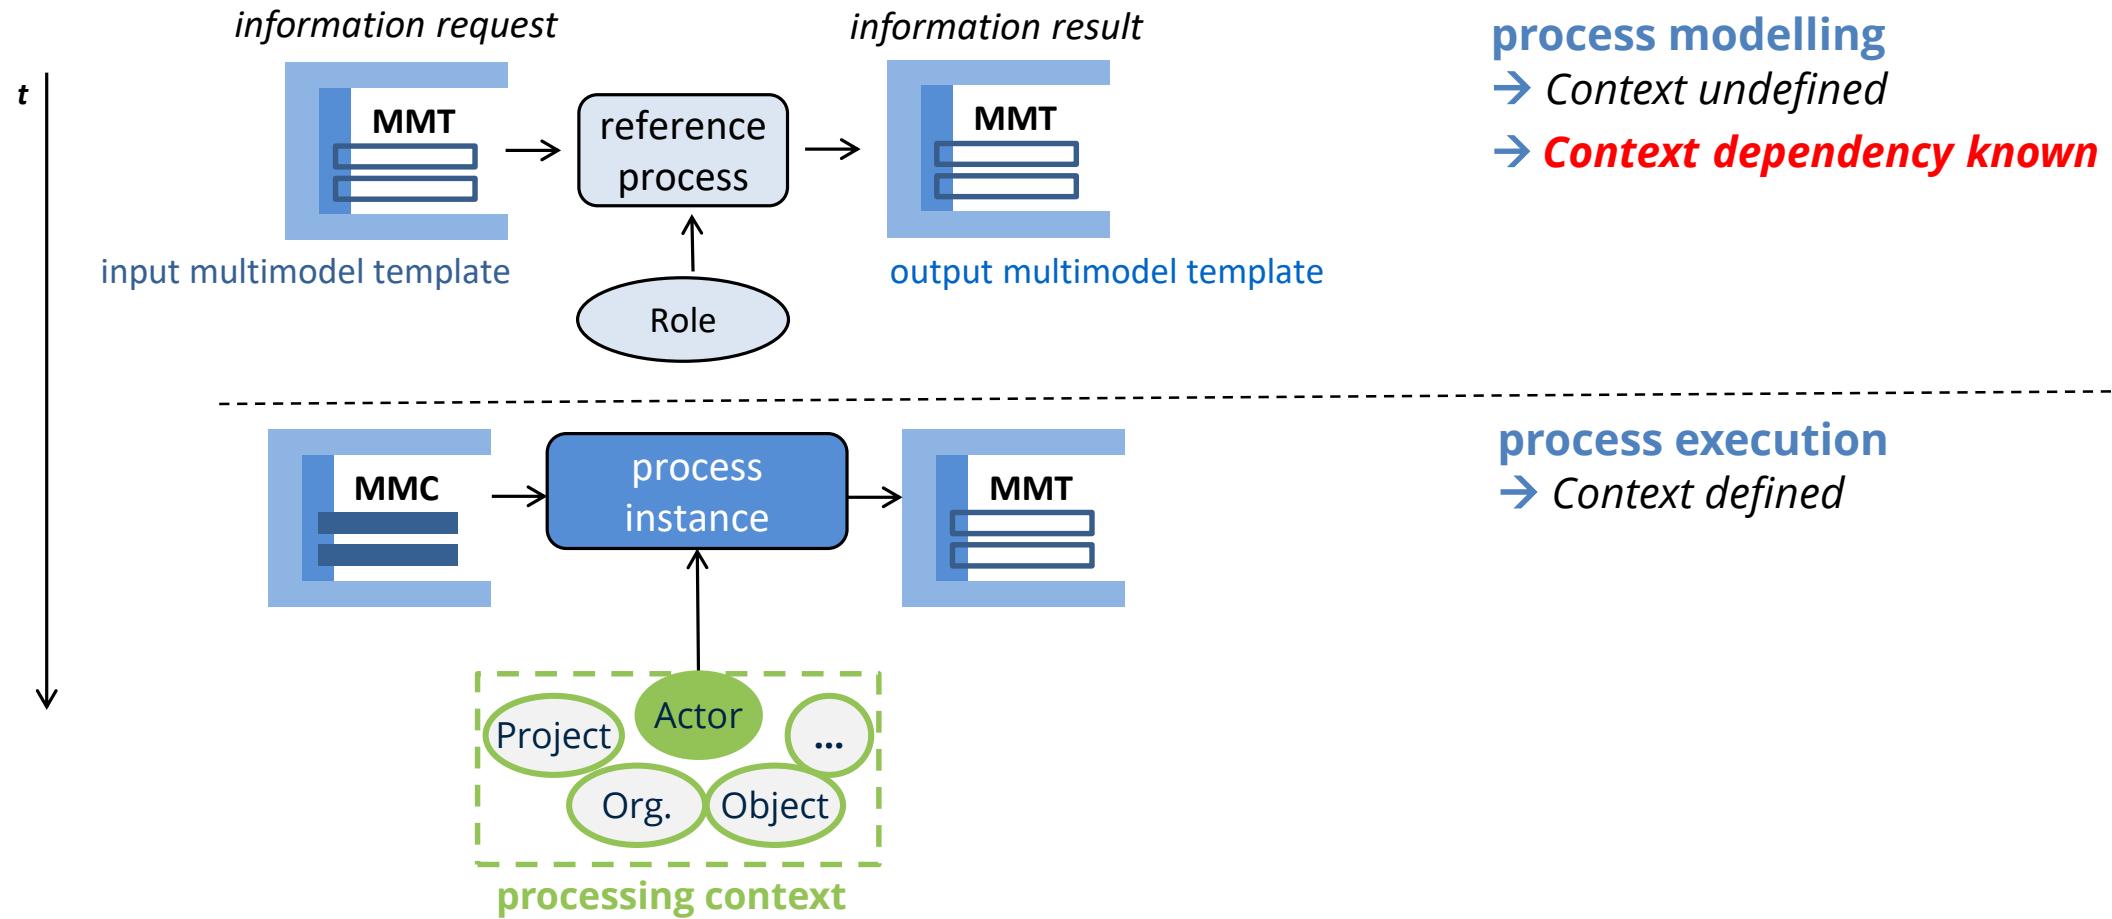

Multimodel templates

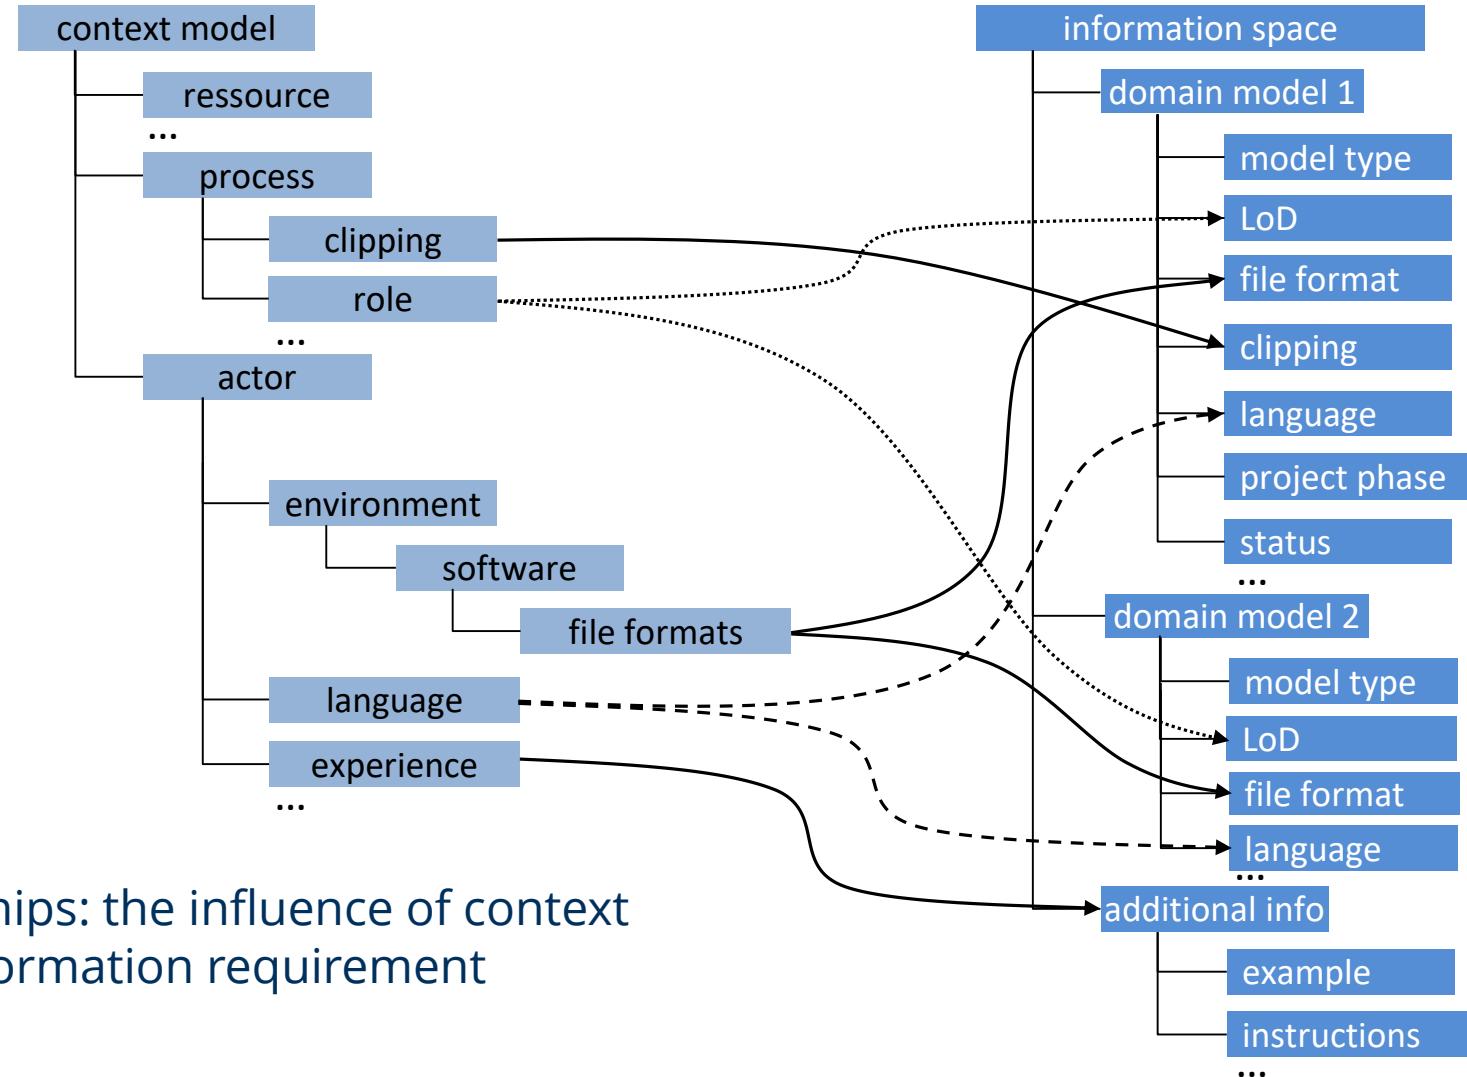

- Metadata can describe Multimodels both **prescriptively** as well as **descriptively**

reference process

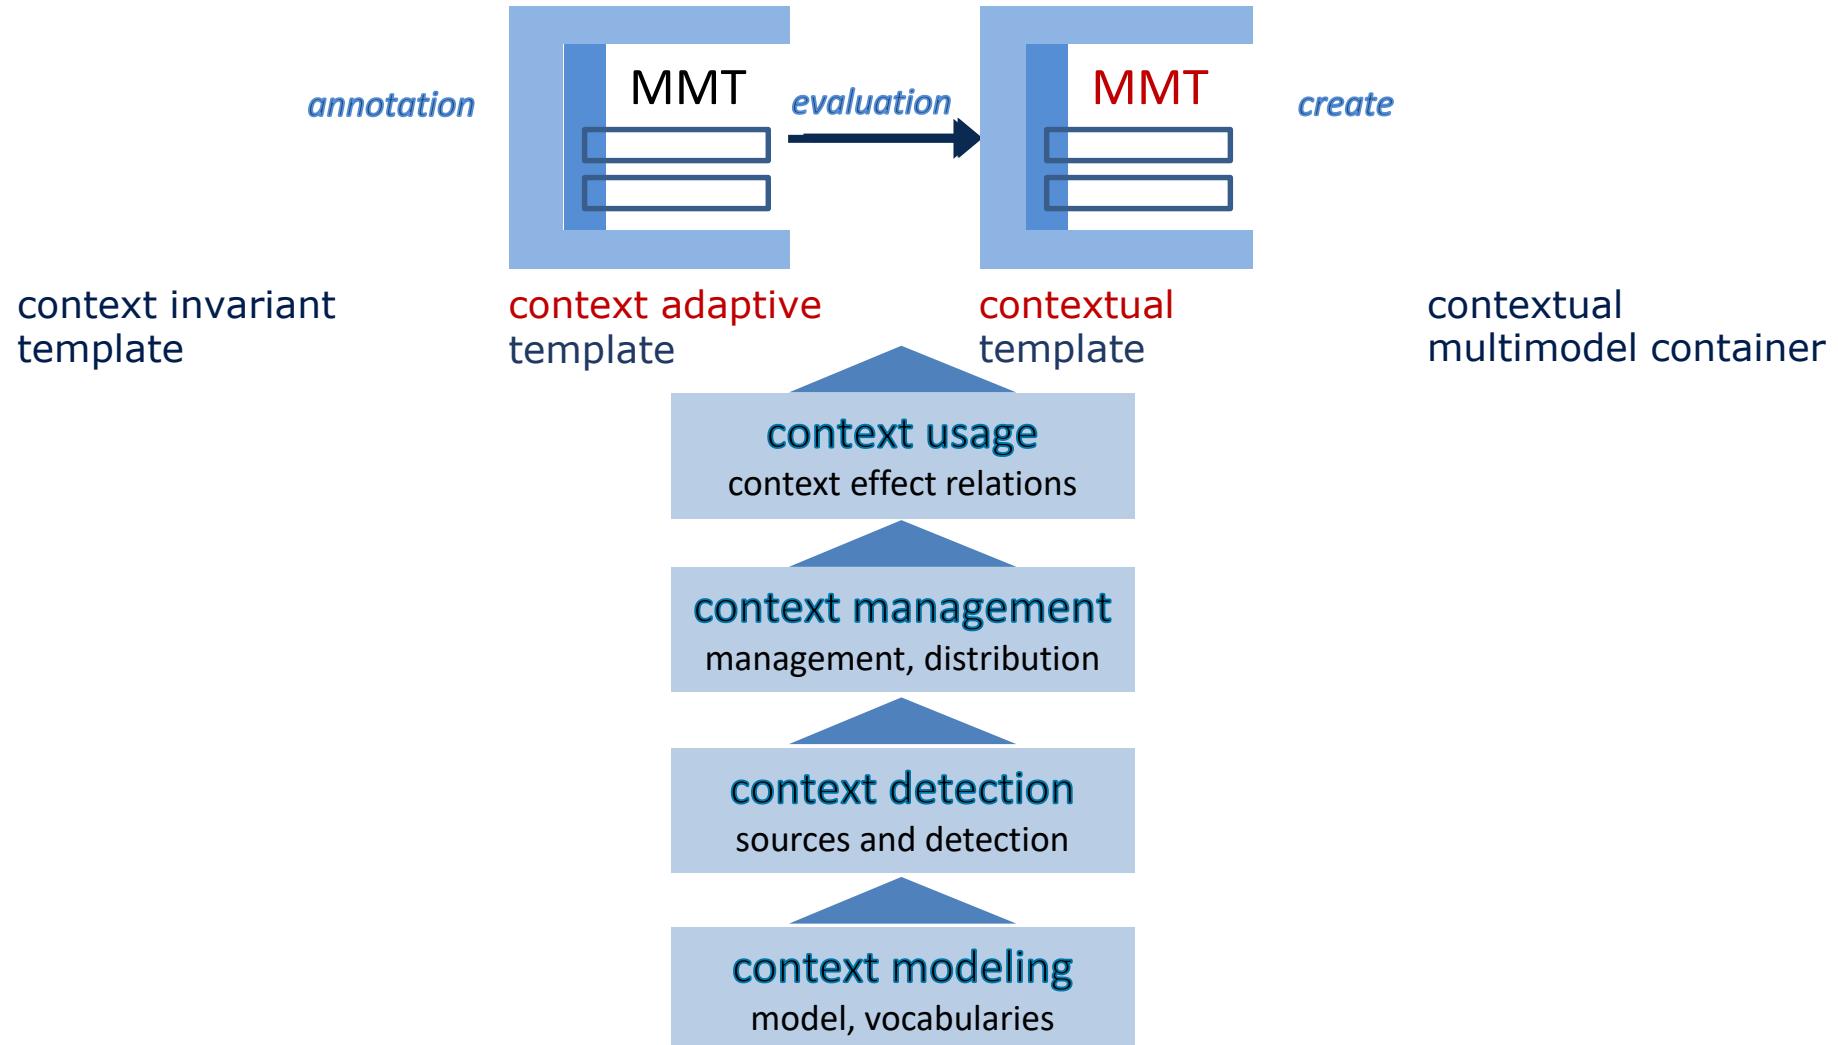

Context Effect Relations

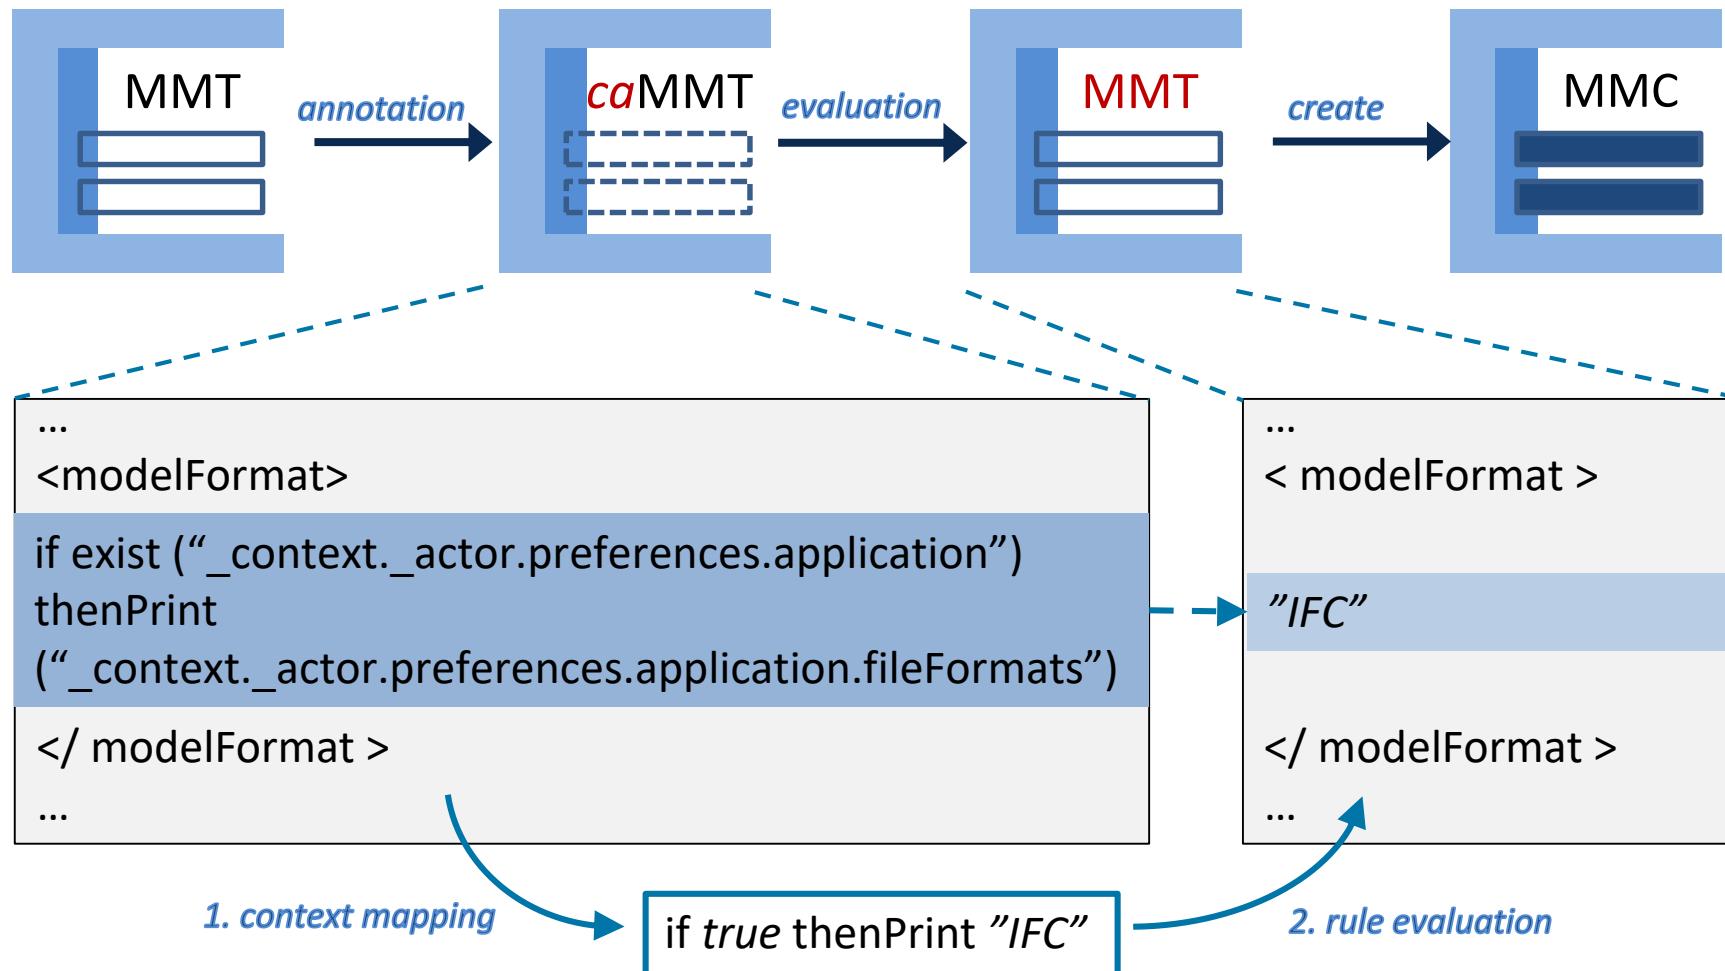

contextual relationships: the influence of context attributes on the information requirement

Approach of a Contextual Information Supply: context integration

Rule Evaluation

mefisto hochhaus bauwerksmodell.ifc

LV1.X81

Vorgangsmodell 2.xml

Los 1

- Beton- und Stahlbetonarb.
- Schalung Stützen d=60cm
- Bewehrung Stützen d=60c
- Beton Stützen d=60cm
- Schalung Stützen d=70cm
- Bewehrung Stützen d=70c
- Beton Stützen d=70cm
- Schalung Stützen d=75cm
- Bewehrung Stützen d=75c
- Beton Stützen 75cm
- Zuschlag für Blitzschutz
- Schalung Innenwände
- Bewehrung Innenwände
- Beton Innenwände
- Zuschlag Kernwände SB 3
- Schalung Decken
- Bewehrung Decken
- Beton Decken

Multi-Model (Angebot_04_F.mmaa)

- Meta-Data
- Link-Models
- Elementary Models
- Multi-Model Graph

Link-Model 'L1' (1755 Links)

BIM IFC 2x3 mefisto hochhaus bauwerksmodell.ifc

GAEB DA 81,82,83 v2009

Mefisto Schedule 1.0 Vorgangsmodell 1.xml

mefisto hochhaus bauwerksmodell.ifc

	context invariant multimodel	context-specific multimodel
BIM building model (bauwerksmodell.ifc)	19,182 kB	1,556 kB
SPM specification models (GAEB LV1.X81)	606 kB	545,145 kB
TSM time schedule model (vorgangsmodell1.xml)	190,322 kB	171,210 kB
link model	2964 Links	1755 Links

Conclusions

- information spaces leads to an increased information potential
- expected further increase in the size and complexity of construction information spaces
- For usability, it is important to reduce the size and complexity of information spaces.
- ensure that the information processes are provided with information that is appropriate to the current situation

presented approach:

- Basis for the generation of precisely fitting information spaces through the formalization of context effect relations
- mapping between contextual factors and affected information space parameters through ContextScript rules in Multimodel templates
- By evaluating them using current context information, a context-specific information space can be precisely described and afterwards generated.
- So we get the possibility to generate context-aware information logistics for Construction information processes

necessary prerequisites:

- functioning context infrastructure (context sources, context logistics)
- Adaptation methods for specific domain information models
